

Gnosys innovation at LCNI 2016

Gnosys Global Ltd attended the Low Carbon Network Innovation conference (LCNI) in Manchester for an intensive three days of networking and discussion about the future of UK power infrastructure. The conference consisted of an extensive seminar series with an accompanying exhibition where recent low-carbon developments were displayed by a number of utilities-based companies.

Gnosys showcased several innovative technologies, including non-destructive condition assessment techniques, novel insulation materials, and self-healing polymers for cable protection systems. We were approached by companies with interests in these areas, with the potential for future collaborations arising from this event.
